

IMPROVED GRAY MOORING COVER FABRIC

SurLast® fabric was specifically designed & constructed for outdoor cover applications, and since its introduction in 1997, has evolved through periodic enhancements. It is a “medium weight - high strength” fabric that performs as a mooring, storage or towable cover. This versatile nature provides the highest value in the market.

Improved Light Gray SurLast® BW+

The BW+ version of SurLast was introduced in 2010 and specifically designed to be the highest performing boat cover fabric. It is a tighter weave that is 15% heavier than standard SurLast with the best water repellency treatment available.

In September of 2014 we improved its UV resistance by using a SaturaMax® yarn which has a 25% higher resistance to UV exposure.

SATURA® is a family of solution dyed polyester yarns that have superior color consistency, light fastness characteristics and is bleach cleanable.

This improvement will enhance product longevity performance under weather & UV exposure, and is now included on all MY16 covers.

This “NEW” light Gray SurLast BW+ with SaturaMax® yarn now provides the following:

- 25% increased yarn resistance to weather & UV exposure.
- Lower surface tension which allows smaller beads of water to run off the cover at a faster rate.
- Increase water repellency by 60% making it 3-1/2 to 4 times greater than acrylic polyester.
- Continues to bead water 3 to 4 times longer than typical treatments.

These differences are very critical to the versatile performance of our Outer Armor® Mooring Cover. More detailed explanations will follow to further explain the features that all work in concert to create the highest and longest protective performance possible.
